**G-FINDER: Global Funding of Innovation for Neglected Diseases**

The ninth G-FINDER survey reports on 2015 global investment into research and development (R&D) of new products for neglected diseases, and identifies trends and patterns across the nine years of global G-FINDER data. The survey covers:

- 39 diseases (including Ebola and other African viral haemorrhagic fevers, which have been analysed separately)
- 151 product areas for these diseases, including drugs, vaccines, diagnostics, microbicides and vector control products
- Platform technologies (adjuvants, delivery technologies, diagnostic platforms)
- All types of product-related R&D, including basic research, discovery and preclinical, clinical development, Phase IV and pharmacovigilance studies, and baseline epidemiological studies.

**A note on Ebola and other African VHFs**

In response to the 2014 West African Ebola epidemic, last year’s G-FINDER survey tracked funding for Ebola R&D for the first time (capturing FY2014 investments). This year, the survey scope was further expanded to include other African viral haemorrhagic fevers (VHFs).

Because of the unique nature of the Ebola threat and the global response – and its distorting effect on investments in “traditional” neglected disease R&D – funding for Ebola and other African VHFs (for both 2014 and 2015) has been analysed separately in this year’s G-FINDER report. As only Ebola was included in both the FY2014 and FY2015 surveys, analysis of YOY funding changes has been restricted to Ebola-specific investment.

**Executive summary**

In 2015, a reported $3,041m was invested in neglected disease R&D, consisting of $2,906m from repeat survey participants (called year-on-year – YOY – funders) and $135m from irregular survey participants. Total YOY funding for neglected disease R&D decreased by $68m (-2.3%). This marked the third consecutive year of declining funding, which has also fallen in every year but one since 2009.

In addition to this investment in neglected disease R&D, a total of $631m was invested in R&D for Ebola and other African VHFs in 2015. This was an increase of nearly half-a-billion dollars compared to 2014 (up $464m, 288%), and meant that Ebola and other African VHFs received more R&D funding than any neglected disease except for HIV/AIDS.

The G-FINDER project is funded by the Bill & Melinda Gates Foundation, and conducted by Policy Cures Research, an independent not-for-profit group focused on providing governments, funders and civil society organisations with the information they need to make optimal R&D policy and funding decisions to deliver new health technologies for diseases of the developing world. For more see: www.policycuresresearch.org
NEGLECTED DISEASE FUNDING BY DISEASE

As in previous years, the ‘top tier’ diseases – HIV/AIDS, tuberculosis (TB) and malaria – collectively received the vast majority of global neglected disease R&D funding ($2,144m, 71%). Overall funding to the top tier fell by $71m (-3.3%). This was driven by decreased investment in both HIV/AIDS (down $56m, -5.4%) and malaria (down $17m, -3.0%), although this followed a sharp increase in malaria funding in 2014. TB funding remained essentially flat (up $2.4m, 0.5%).

Funding for ‘second tier’ diseases fell by $38m (-5.9%), with drops in funding for kinetoplastids (down $21m, -18%), diarrhoeal diseases (down $18m, -11%), hepatitis C (down $11m, -25%) and helminths (down $10m, -13%) partially offset by smaller increases for dengue (up $12m, 14%), bacterial pneumonia & meningitis (up $8.7m, 12%) and salmonella infections (up $2.0m, 3.2%). ‘Third tier’ diseases – leprosy, cryptococcal meningitis, trachoma, rheumatic fever, Buruli ulcer and leptospirosis – each received less than 0.5% of global R&D funding. Non-disease-specific investment increased by $43m (up 25%), following a sharp drop in 2014.

NEGLECTED DISEASE FUNDERS

Public sector funding for neglected disease R&D fell once again in 2015 – extending the decline seen since 2012 – while industry investment edged slightly higher, following a significant increase in 2014. Coupled with a small drop in philanthropic funding, these changes resulted in both the lowest public sector funding share and the highest industry funding share ever recorded in the history of the G-FINDER survey.

The public sector still provided close to two-thirds of all neglected disease R&D funding ($1,925m, 63%), almost all of which came from high-income country (HIC) governments and multilaterals ($1,866m, 97%). The philanthropic sector provided 21% of global funding ($645m), and industry contributed the remaining 15% ($471m).

R&D funding by disease 2007-2015^
The top three public funders in 2015 were the US, the European Union (EU) and the UK, with the US contributing over two-thirds of total public R&D investment ($1,378m, 72%). Of the top three funders, only the EU (up $21m, 20%) significantly increased funding in 2015, reflecting its expanded contributions under the second phase of the European and Developing Countries Clinical Trials Partnership (EDCTP). Funding was lower from both the US (down $44m, -3.0%) and the UK (down $22m, -18%). Other notable drops in public funding came from Australia (down $16m, -47%) and the Netherlands (down $13m, -76%), the latter due to the Dutch Ministry of Foreign Affairs’ (DGIS) transition between product development partnership (PDP) funding rounds.

Private sector investment in neglected disease R&D in 2015 was the highest ever recorded in the history of the G-FINDER survey. YOY industry funding increased marginally (up $7.1m, 1.7%), driven by a $4.7m increase in investment by small pharmaceutical and biotechnology firms (SMEs, up 9.9%). Philanthropic funding decreased slightly (down $22m, -3.5%), mainly due to reduced funding from the Wellcome Trust (down $27m, -22%). Funding from the Bill & Melinda Gates Foundation (the Gates Foundation) was steady (down $2.3m, -0.4%).

### Neglected Disease Funding Flows

Almost three-quarters of all neglected disease R&D funding in 2015 was external investment in the form of grants or contracts ($2,202m, 72%). Three-quarters of this funding went directly to researchers and developers ($1,656, 75% of external investment), $450m (20%) went to PDPs, and the remaining $96m (4.3%) was channelled through other intermediary organisations.

Direct YOY funding to researchers and developers decreased slightly (down $38m, -2.3%). Funding to PDPs fell even more significantly (down $65m, -13%), although this follows two years of successive increases, and reflects the highly cyclical nature of grant funding to PDPs, especially from the Gates Foundation. Funding to other intermediary organisations increased substantially (up $31m, 50%), primarily driven by increased funding from S&T agencies to EDCTP2 (up $22m, 83%).

### Funding for Ebola and Other African VHFs

A total of $631m was invested in R&D for Ebola and other African VHFs in 2015. The vast majority of this was Ebola-specific ($574m, 91%), with Ebola funding more than tripling (up $411m, 258%) from 2014 levels. Most funding was for vaccine development ($388m, 61%), with smaller investments in drugs ($103m, 16%), basic research ($59m, 9.4%) and diagnostics ($23m, 4.4%).

The public sector ($383m, 61%) was the source of nearly two-thirds of all R&D funding for Ebola and other African VHFs in 2015; industry investment ($226m, 36%) accounted for most of the remainder, with just 3.4% ($22m) coming from the philanthropic sector. Intermediaries such as PDPs played little to no role – funding was either invested in internal research programmes or given directly to researchers, including to industry.
DISCUSSION

The scale and nature of the global R&D funding response to the West African Ebola outbreak is now truly apparent

- In 2015, a total of $631m was invested in R&D for Ebola and other African VHFs – more than in any neglected disease except for HIV/AIDS.

- The US Government provided 78% of all public funding for Ebola and other African VHFs, despite a more than five-fold increase in Ebola R&D investment by European public funders.

- Industry invested $226m in R&D for Ebola and other African VHFs in 2015, far more than they did in any single neglected disease, and more than their combined investment in all neglected diseases other than malaria and TB.

Global funding for neglected disease R&D reached historic lows in 2015, driven by declining public sector investment

- In contrast to Ebola and other African VHFs, funding for neglected disease R&D in 2015 fell to its lowest level since 2007, with YOY global funding now $180m below its 2012 peak.

- Public sector funding for neglected disease R&D also fell to its lowest level since 2007, driven by another drop in US Government funding (down $44m, -3.0%), which fell to the lowest level ever recorded in the history of the G-FINDER survey.

- Increased funding from the EU (up $21m, 20%) made it the second-largest public funder of neglected disease R&D globally in 2015, moving ahead of the UK (down $22m, -18%).

In sharp contrast to the public sector, industry investment in neglected disease R&D reached historical highs

- 2015 was the fourth year in a row that industry has increased its investment in neglected disease R&D – the only sector to have recorded year-on-year growth for such a stretch.

- Industry’s share of global funding is now comparable to that of the Gates Foundation, although this level of investment in neglected disease R&D by industry may be put at risk if public funding continues to fall.

- Industry funding was focused on a subset of neglected diseases, with malaria and TB alone accounting for more than half of all industry investment in neglected disease R&D in 2015.

The highly concentrated nature of neglected disease R&D funding remains an area of concern

- Researchers and developers continue to rely upon a small number of large funders, particularly the US Government (the US NIH especially) and the Gates Foundation.

- 40% of all neglected disease R&D funding goes to organisations that receive more than 80% of their funding from the US Government, which has reduced its funding for neglected disease R&D by a quarter of a billion dollars since 2012.

- PDPs remain highly reliant on the Gates Foundation; in 2015, nearly half of all PDPs received more than half their funding from the Gates Foundation.

Conclusion

- The findings of this year’s report show that there are significant additional financial resources available – including from the pharmaceutical industry – for R&D into infectious diseases that largely exist only in the developing world.

- When funding for Ebola and other African VHFs is added to that for neglected diseases, global investment in R&D increased by $396m (up 13%) in 2015 – the largest single year increase ever recorded by G-FINDER – with public funding growing by $210m (up 10%) and investment by industry nearly doubling (up $201m, 44%).

- There is an opportunity to capitalise on the lessons learned from the global response to the Ebola epidemic – not only to ensure that we are better prepared for the next emerging infectious disease outbreak, but also to secure adequate and sustainable R&D funding to address the existing and much larger challenge posed by neglected diseases.
